

# TD - Frontend

## Develop a frontend application

**Prerequisite:**

- Git installed
- Github account
- SSH key configured on Github & local Git

### 1. Project code

Create a new Github repository to host your frontend code, clone it on your computer and work in this repository.

### 2. Basic Layout

The frontend is composed of at least:

1. One login page (containing a link to the register page)
2. One register page
3. One "Location" page in which all locations are listed in a paginated array

### 2. User Stories

**US1:** As a random visitor, I want to be able to register an account or log-in, so I can access all features

**US2:** As a random visitor, I want to be redirected to the login/register page when I click on "location" tab, so that I know I must log-in to see its content

**US3:** As a logged-in user, I want to see locations and be able to click on one location to open a modal containing details, so that the website is useful

**US4:** As an "admin" user, I want to see a "Add Location" button in the location page, so that I can create a new location

**US5:** As an "admin" user, I want to see a button to edit locations in the array of locations, so that I can edit existing locations

**US6:** As an "admin" user, I want to see a button to delete locations in the array of locations so that I can delete existing locations
